June 23, 2022

The Honorable Ron Wyden  
Chairman Senate Committee on Finance  
221 Dirksen Senate Office Building  
Washington, DC 20510

*Re: Fight Electricity Price Inflation by Supporting Electricity Transmission Competition*

Dear Chairman Wyden,

On behalf of the Electricity Transmission Competition Coalition and the undersigned organizations, we urge you to support electricity transmission competition in the fight against inflation. On April 21, 2022, the Federal Energy Regulatory Commission (FERC) released its notice of proposed rulemaking, but instead of supporting transmission competition, FERC chose to shield incumbent monopoly electric utilities – a decision that will lead to higher costs for consumers. We urge you to communicate your concern to FERC.

Across the country, consumers are being exploited by incumbent electric utilities that have circumvented FERC Order 1000, which was supposed to usher in an era of competition. Despite that order, studies have shown that only about 3 percent of electric transmission projects are competitively bid.¹

As of May 2022, electricity price inflation for the last year was 12 percent, outpacing the Consumer Price Index, which is already at 40-year highs. Inflation in electricity is putting further pressure on households and businesses already grappling with uncertainty over the current business environment and persistent supply chain issues. President Biden has made fighting inflation a core part of his agenda, and support for electricity transmission competition will not only lower costs for consumers but help the US reach its climate goals.

Transmission competition is a critical part of President Biden’s plans to decarbonize the economy, which is projected by some to require record transmission spending. Under one of the scenarios outlined in Princeton University’s “Net Zero America” study scenarios the United States may need to spend $2.1 trillion by 2050 to build out the transmission grid.²

Fig. 1: Compared to the overall Consumer Price Index, energy price inflation rose faster over the last 12 months.

Research has shown that competition can reduce the cost of transmission projects by 20-30 percent. Therefore, a middle range 25 percent savings would save consumers an estimated $170 billion in construction costs. Open competition is a key driver of innovation in the private sector, lowering production costs but also lowering the bills that consumers pay, alleviating long-term inflationary pressures. In short, electricity transmission competition is an important policy solution to our electricity inflation problem.

Incumbent electric utilities oppose electricity transmission competition and would have you believe that electricity electrons stop at a state’s border. The majority of transmission projects involve interstate commerce and that is why changes to FERC’s regulations are needed to ensure that consumers benefit from competition and lower costs.

Thank you in advance for protecting consumers from monopoly power and higher costs.

Sincerely,
Paul N. Ciclo

Paul N. Ciclo
